The Hunate Book

*Exploring ways to restore balance and harmony
among Humanity, Nature, and Technology*

KHEM RAJ PRADHAN

This is for every human of this world. Young, adult, old, everyone, and those who are yet to be born.

I want every one of us to understand the self, and nature and its elements, and our tools and technologies, and how to keep peace and harmony among us all. This is our home. It is all our responsibility to understand it, to protect it, and to help preserve it.

We are all connected, past, present, and future. What we eat, what we think, what we do, creates tomorrow. Nature treats us as we treat it. We must be conscious. And every human, thriving, must try to be the best version of the self, every day.

 A Final Word..... 74

FOREWORD

A FIRE TO THINK BESIDE

I did not write this book to give you answers. I wrote it to share my questions, the ones I could not stop asking.

I am not a scholar. I hold no degree in philosophy or economics or religion. I am one human who looked at the world he was born into and felt, in his body, that something was deeply wrong, and who has spent his life trying to understand what. What you are holding is the result: my attempt to name the system we are all living inside, to ask why it is built the way it is, and to imagine, out loud, a different way to live.

I have written it raw, in my own words, with my own anger and my own hope, because I do not want to sell you a polished idea. I want you to feel what I feel, and then to think for yourself. Some of what I say will sound extreme. Some of it may be wrong. I do not claim to hold the truth; I claim only to be looking for it honestly, and to invite you to look with me.

If you have ever felt that the world does not make sense, that we are all running a race no one chose, that there must be a better way to be human, then this book is for you. Read it not as a doctrine to accept, but as a fire to think beside.

Welcome to the research. Welcome to Hunate.

Khem Raj Pradhan

THE HUNATE BOOK

Not a Registered Project: An Independent Project

This is not any INGO, NGO, non-profit, non-governmental organization, political party, group, religion, or company business. This project does not fit into any of it.

This is a life itself. This is a community itself. This is a world itself.

We are already registered persons in certain countries, and we see no point in registering when we eat, sleep, and work. Imagine we are just humans, getting together to find truth, to explore and learn it. We want to discover truth and natural ways, and we want to share our findings. Simple. I do not see a point in registering as humans.

If we want to help our neighbour plant some plants, if we want to help someone build a house, why should we register it? If we invite guests to our home, if they bring a gift, if they help us with our daily chores, if we feed them, why should we register it and inform the government? Do we ever do that?

No. Because it is just living as humans, doing what we do every day. So where does this thing come from, this need to make a team, a group, and register it?

We do not like this approach. We want to do something good for the community. We want to help. We want to spend our lives finding our bond with nature, helping nature heal, helping humans find better ways to live, helping people build homes and farms and businesses for free. What is there to register? We are doing what humans are supposed to do, to plan and to live for a better future. Can humans not come together to build a better society without registering? We believe we can, and that is what we are doing, sharing what we think, and those who are interested are free to work independently, or as they wish.

And if we look at the registered NGOs and INGOs, what have they really done, beyond politics and power games? They have not solved war, or poverty, or pollution, or our self-destruction, or a failing system, or a failing future. Look around. They are a show for politicians. Not even three percent of the donations reach the ones in need; the rest is spent by the organization itself, in the name of operations, administration, transport, team-building. It is the big lie of a registered company.

And these big organizations jump into crises in other places and countries as if they know everything, as if they are the solution. We do not believe in that either. The problems of a specific place must be solved by the locals, who know the whole picture, the climate, the seasons, the culture, the lan-

guage, the history. We believe in local authority and local control over local problems and their solutions, and we aim instead to train such humans, capable ones.

From our own experience, they use these registration policies and rules to keep control over your project, your ideas, your path. First the system is built to show you the importance of registering, how it lets you apply for grants from the government or from international bodies, and I have seen most people register for exactly this. Then they hand you their pre-set rules on how to build your constitution before you have even sketched your own plan. You have to fit into them. You must have boards, meetings, criteria, voting, power dynamics, hierarchies, politics. That is not our way.

THE HUNATE BOOK

Why Hunate Exists

Hunate exists because I could not accept the world as it was handed to me.

Everywhere I looked, I saw suffering that did not have to be there: hunger on a planet that can feed everyone, war among people who all want the same peace, children born not into a birthright but into a debt. And everywhere I looked, I saw people accepting it, calling it normal, calling it life. I could not.

So Hunate began as a single refusal, and then as a search. It exists to ask the questions no one is asking out loud, to find what went wrong in the way we live, and to build, in the real world, a way of living that works, for humans, for nature, and for the tools we make. It exists because I believe we can do better, and because believing it is not enough; someone has to try. This book is where the trying begins, with the honest, uncomfortable questions.

THE HUNATE BOOK

A World in Crisis: The Pain of Progress

We humans have not been here for just five thousand years, this is for certain, and the history they teach and spread is wrong. Who is writing this history and forcing it into the schools, the media, the whole world around us? Where did we come from? Did we evolve here on earth? And why is only one culture promoted among the thousands of cultures around the world? Why are there no true stories from every corner of the earth?

There is no way that religion, the stories of gods who are supposed to unite humans, should be so full of anger and war. Who is reading these teachings? Are they truly pure and loving and forgiving in their hearts?

Leaders and politicians are supposed to lead us. They are supposed to unite people, to make smart, ethical, moral decisions. Why, then, are they fighting one another? What do we learn from them, except to fight, to go to war?

Why do the armed forces not help the sick, the weak, the poor, the suffering? Why do they protect power, politicians, rulers, corporations? Are they blind, these humans following the orders of a few? They are humans too. Why can they not decide for themselves what is right and what is wrong? How have they been conditioned?

Do we even know ourselves, our body, our mind, our emotions, our soul? Why do we not speak of it? Why do we not learn how to use ourselves? Why do we not teach our children about the human body and how to live in it, about our bond with nature and other humans and animals and the stars? This should be the first and most important thing we ever learn. Otherwise, how would we know what to do with ourselves? What will you do holding a guitar if no one ever teaches you to play it?

And why do we give a child birth, but not birthright? Why do we not give them the important knowledge? Why do we not give them fresh air to breathe, and land to begin on? Why do we not give them the free things, air, water, land, food, knowledge, life itself, as a birth gift, a welcome to the earth? Why must they begin by depending on a failing system? Why

must they start by paying for food, for a place to live, for water, for clothes, for knowledge, for truth? Why are we punishing them? It was not even their choice to come into this world. Why do we condemn them, too, to fit inside this failing system? Why do we force them to become its slaves?

There is land enough to grow an abundance of food for every human on earth. Why are we planting nothing? Why do we not see food trees, fruit trees, nut trees everywhere we look? Why are we not planting everywhere, so that every human and every animal, now and in the future, could eat freely from wherever they stand? Who is manipulating people into destroying every food plant and tree on this earth?

Why do we not know our own earth? What is nature? What are its laws, its systems? What is our bond, as humans, with it? Why do we not protect it? Why do we exploit it, pollute it? Why do we not understand that it is our home? Why do we still know almost nothing about the land, the water, every part of nature? Why do we leave no place for the other species, the animals and birds and fish, to live freely? Why do some people draw borders around natural resources and sell them? Who gave them that authority?

What is wrong with our education system? Why are we not taught about humans, family, and community at school? How, then, are we supposed to survive and live? What is the point of it? Why do schools not teach what really matters? Education is supposed to liberate people. Why is it failing, making humans more lost instead? Who built this system, and why is it forced upon us? What are they preparing us to become? Why do they

not teach us about ourselves, our community, our family, nature, animals, food, space, problem-solving, technology? What are they creating humans for?

Why is money the ultimate goal of life? Who created it? Who prints it? Who gave them permission to print it, and how much? When did it begin? What is its purpose? Is it natural? Is it truly helping humans? Is there not a better way, a better system, to produce and exchange what we need?

Why do we have cities, built and run the way they are? Is it healthy? Who started it? Is it natural to live like that? Can we even grow food and sustain life inside a city? Who is promoting it? Who is manipulating everyone into chasing city life? Is it really so full of luxury and comfort and convenience?

And why is our technology not serving humans and nature? Why is it not used for farming, for health, for producing and storing and sharing and moving what we need, for research and exploration, freely, for all? Does technology need food and money too? Why is there still war, still poverty? Why are there still fake histories?

There are so many questions in this time. Perhaps it has always been this way, and always will be, as long as humans live, for we are curious beings. But these are serious questions, questions of human stupidity. The improper division of land, the hoarding of resources, the destruction of free water and food and land and air, the exploitation of whole countries, the pollution, the war, all of it is here, in our world, right now. The whole world, knowingly or not, is built upon a profit-based economy, and these are its consequences: scarcity, greed, hunger, fear. It is very stupid.

Who Runs the World: The Declaration of War

Looking at all these problems, it begins to seem that no human is truly ruling this world. Something else is controlling it, manipulating it from behind. Something feels deeply off about this man-made social system, and I am serious when I say so.

No ordinary, ethical, moral human would destroy itself and the very home it lives in. No normal human would abandon family and community. No human would kill nature, the thing that gives us everything. No human would be so selfish, so stupid.

So consider the possibilities. One: that some other force, call them aliens, or devils, or fallen gods, is ruling this world from behind the screen, constantly manipulating it, making humans dumber and dumber, into slaves, doing all the work while they sit back and enjoy it, or perhaps experimenting on us, for interests of their own.

Or two, and this is what I keep returning to. Perhaps, as we evolved, alongside homo erectus and homo sapiens and the Neanderthals, there were other branches too, other kinds of humans, driven far more by greed, control, power, hunger, and domination. They are good at it. They are smart, even creative, perhaps more than we homo sapiens believe ourselves to be. Let us call them Homo Domo.

We can see the logic of it in nature itself. Through evolution and adaptation, some of us grow tall and muscled, some small, some dark, some light. Some are shaped by their hormones toward anger, some toward kindness, some toward generosity

and love. Some minds are sharp, some dull. So why not this: that some evolved to be crueller, more power-hungry, more evil, even psychopathic. And those who have ruled for a long time may have grown their minds and bodies and emotions in such a way that they cannot imagine ever giving up their power, their position, their fame. They would need to possess it all, the knowledge, the land, the media, the businesses, the ideas, the technologies, in order to keep control. And to this day, we are manipulated, controlled, and educated to believe that we are homo sapiens, the smartest beings alive, which is itself a lie. These Homo Domo control everything, and they care nothing for humans, for nature, or for the future.

If any of this is true, then understand what Hunate is. Hunate is a war. It is a war between the rulers, the greedy, hungry, dominating, evil kind of human, the Homo Domo, and the humans who want a better world, healthier people and nature, shared resources, abundance, love, support, a global family, and true evolution, the Homo Sapiens.

And I will say plainly why I hold to this. To me it is not merely a theory; it is close to a fact. Look at a royal family, and you will see that they walk and talk differently from common people, even on the same road, even speaking the same language. Those who have ruled for generations cannot imagine losing their power and their dominance, and they will use everything they have to keep it. Such humans have branched off, I am sure of it: the more hungry, the more possessive, the

more controlling. Call them fallen angels or demons if the old books help you; I say they are simply a kind of human, one that stands against the health of nature and the earth and humanity and the future, that wants to hold everything in a single lifetime and ruin the rest. Every colonization happened this way, because there were healthier, kinder, giving communities across the south and the east, and there were others who wanted it all. Even now, the powerful would kill millions rather than let another rise above them, to keep their dominance of the world, not all of a people, but the few behind the screen. These are the Homo Domo I speak of, and they designed this failing system, and the rest of us are only playing along.

And we, the homo sapiens, are not so evil. We are not greedy by birth. We want family, love, community. We care about nature, about spirit, about our bond with the living world. We care about the future. We care about life, and about a higher purpose. We cry, we are hurt, we forgive, and we want, all of us, a better life.

Freedom or Illusion: The Many Lifestyles and Choices

There are countless ways to live a human life. Infinite paths stretch before us, as many as the minds that imagine them. You can choose to be an artist, a monk, a teacher, a wanderer, a politician, a carpenter, a doctor, a rebel, a mystic. You may walk with religion or reject it. You might belong to a nation, a people, a philosophy, or live untethered. You might speak one of thousands of languages, believe in science or in

spirits, follow ancient tradition or create something entirely new. Humans are dynamic by nature. We are moulded by histories, myths, and memories, shaped by stories both seen and unseen. We come from an infinite past and dream toward an unknown future. Every lifestyle, every culture, value, belief, food, and form is a unique expression of this human potential.

We are beings of great adaptability, and that is one of our deepest strengths. The human mind, body, and soul are capable of transformation through intention and experience. The way we live, the food we eat, the air we breathe, the work we do, the thoughts we carry, the books we read, the relationships we nurture, the environments we inhabit, all of it shapes us. These are not merely personal preferences; they become biological, emotional, and spiritual realities. A carpenter and a priest, a pilot and a yogi, each lives a different rhythm, each walks a different terrain, each requiring a different diet and mindset and routine and environment to truly embody the chosen path. If we want to become something meaningful, we must live in alignment with that vision. Lifestyle is not separate from identity; it is the architecture of who we become.

Every decision has consequences. Every choice, however subtle, leaves an imprint, a ripple. There is no action without outcome, no freedom without effect. Some lifestyles nourish life; others quietly destroy it. Drinking, smoking, and late-night indulgence may feel like freedom, but they corrode the body and weaken the spirit. Endless consumerism exhausts the earth. Business can empower, but it can also exploit. Religions can guide, but they can also divide. Even education,

when disconnected from ethics, can become a tool of control. The point is not to judge these paths, but to see them clearly, to understand where each road leads.

Today we face the shadow of our collective choices. The very systems we thought would liberate us, modern development, mass education, technological expansion, social freedom, now show the signs of collapse. The promise of progress has brought with it stress, pollution, disconnection, overconsumption, and a kind of silent despair. We are more anxious, more isolated, more dependent on unsustainable systems than ever before. Nature is crying. Families are fracturing. The future is at risk. We are losing not just our resources, but our meaning. And yet, in this crisis lies a truth: we still have the ability to choose.

No one can force a soul to live in a certain way. Each person must walk their own path, and the diversity of those paths, their beauty and complexity and creativity, is something to be celebrated. We must honour the full spectrum of human life. After all, light is only understood in contrast with darkness, wisdom often comes through mistakes, and growth demands that we reflect, re-evaluate, and redesign. That is what it means to be human: not to be perfect, but to be willing to change.

We too have chosen a path, not the only one, but the one that feels true to us. We call it Hunate. Hunate is more than a lifestyle. It is a system of life rooted in awareness, balance, and purpose. It emerges from our understanding of nature, from our study of ancient and modern wisdom, and from our deep commitment to the earth and all its beings. It is a way of living

that honours both the individual and the collective, both freedom and structure. We hold a perspective on our past, our present, and our future, and we feel a responsibility to live in harmony with the natural world, to design life consciously, and to make space for the generations yet to come. This is our offering: a way to remember who we are, why we are here, and how we might live, not just to survive, but to thrive together. This is the way of the Hunate.

Who Among Humans Is Hunate For?

We do not claim to have all the answers. But we have built a way to live, rooted in ancient wisdom, shaped by modern understanding, and full of questions. Hunate is for anyone who has ever asked: *Is this really what life is supposed to be?*

It is for:

- Parents who want to raise awakened, healthy, and capable children.
- Youth who refuse to follow the blind, failing social systems.
- Elders who carry a deep wisdom in their silence and want to share it, whose medicine comes from long experience, from a connection to the old ways, from patience and from seeing things over a long time.
- Seekers, rebels, farmers, designers, teachers, and wanderers.

- Citizens of the earth who are ready to remember, to reflect, to relearn, and to redesign the future.

Hunate is a way to live, a lifestyle, a calling, a guide for those who see the downfall of humans and nature caused by the systems we live in now, knowingly or unknowingly, and who want to change themselves. For those who know we cannot keep living like this, cannot keep destroying what gives us life, our bodies, our families, our earth, our space, and who are ready to begin to heal and redesign it. For those who do not want to depend on or support this failing system in any way, and are looking for a natural, alternative way to live. For those who believe we cannot ignore the future generations or nature while we live in this so-called developing era, and are ready to let go of fake passions and selfish dreams for a better tomorrow, to set aside personal comfort for the good of all. For those who understand that the cost of not choosing this path is a future of deeper unhealthiness, more disconnection, and less for those who come after us.

This book is for remembering. For reconnecting. For reimagining. It is here to help you look deeply into your own life, your life with your family, your life with your community, with full awareness and practical tools. It is here to help you heal yourself, your family, your friendships, and the land, to raise your family, to start your community, or simply to become more whole, in whichever way life calls you.

THE HUNATE BOOK

What is a System: The Ways Things Work

Everything in existence works in a certain way. Animals have their own way, water flows in its own way, the wind moves in its own way, the planets spin in their own way. They all have a system by which they function and interact.

A system is simply a way to operate. It is a set of laws, policies, rules, or guidelines that allow something to work within certain limits to reach a desired outcome. But systems are not just rigid rules; they are living, interacting ways of connection.

Understanding Systems: Natural and Human-Made

We can see two main kinds of systems: the systems of nature, and the systems made by humans to survive and live on the earth.

Some of our human-made systems are these: our family systems, social systems, agriculture systems, education systems, healthcare systems, governing systems, communication systems, religion systems, country systems, economy systems, and transportation systems.

And some of nature's systems are these: the earth's own system, with its seasons and its atmosphere and geosphere and biosphere; the ecological systems; the astronomical systems, like our solar system; the tiny atomic systems; the thermodynamic systems; the climatic systems. We cannot change nature's systems themselves, for they are fundamental. But it is wise to understand them deeply and to learn to live within them, following their natural laws to find balance and harmony. Our job is to understand how nature works, and then to align our human ways with its wisdom.

So Hunate, too, is one of these systems. But unlike the broken systems that push us toward destruction, Hunate is built to research, to explore, to search, to find, and to share an alternative, nature-based way of life for humans on the earth. This system is designed to hold the balance and harmony among Humanity, Nature, and Technology, while always taking the past, the present, and the future into careful consideration.

THE HUNATE BOOK

The Research System

Two Ways, and the Middle Way

A

s I understand it, there are two ways to live, and most of the world is fighting between them right now. One is called the modern scientific way; the other is called the unscientific way. Though, honestly, the first is not even truly a modern scientific way at all. Since ancient times, in the education systems of India and elsewhere, there were always people who chose observation, calculation, mathematics, and practicality to reach the ultimate truth. And there were others who used experience, intuition, logic, feeling, and emotion, and these we came to call unscientific.

Those who studied mathematics and numbers and theory, we call scientists. Those without that knowledge, we call ordinary people. But we cannot say that only the scientist knows life. The one who never studied knows life too. The scientist may need a map to reach the destination; that does not mean the unlettered traveller cannot arrive at the same place by another road.

We must understand this. Life happened. People are able to learn on their own, as they learned to walk, to eat, to speak, to climb, with no one to teach them numbers or theory first. Neither way is wrong. The scientist calculates and observes in closed conditions and reads life through theory; the ordinary person learns through feeling, through deep observation, through meditation. And there is a third way, moving between the two, the measured and the felt, finding the balance, knowing what to use and when. That middle way is the way of Hunate.

The Failing Systems: The Problems We See

At this time, things are going very badly. We, who call ourselves smart, are no longer acting smart. We are destroying the very things that matter most, and it is worth naming them plainly, in three parts: ourselves, our nature, and our tools.

Ourselves, the humans. We are harming ourselves in body, mind, and spirit. We live inside false stories and false histories, eat unhealthy food from broken industries, and fight wars over who controls nature's gifts. Our work is unhealthy, our habits corrode the body, and our systems are built on profit rather than on people. Our education misleads us, pushing us toward addiction, fake purposes, greed, and fear, while poverty and religious wars tear us apart.

Nature, the earth and all it holds. We are taking over its land, cutting down its forests, leaving no room for the animals. We struggle even to grow food, or to manage the earth's resources wisely. Our farming poisons the soil, we burn its fuels, and we pollute the air, the water, the land, and even the silence with our noise. We treat nature's gifts as our possessions rather than as shared life.

Technology, our tools for living. The very tools we made to help us are now the ones causing harm. We waste energy and build things that pollute. Our medicine is expensive and full of chemicals, and it maintains us rather than heals us. Even with all our clever tools, there is still not enough food, transport, education, or health for everyone. New diseases appear, social media makes us addicted, and our films and sports and celebrity culture feed us false ideas. Our real problems go unsolved, while our machines and vehicles keep destroying

nature and drowning it in plastic. And in the end, we are leaving nothing good behind, no healthy earth, no good life, for the generation that comes after us.

The Breakdown: Where Our Systems Are Failing

Let us look, then, honestly and without flinching, at exactly where our systems are breaking. These are not distant problems in some faraway place; they are right here, inside us and all around us, in the body and the family, in the economy and the school, in the soil and the sky. I have tried to see each one clearly. As you read, do not take my word as final; look at your own life, and see for yourself.

I. THE HUMAN CONDITION: OUR INNER AND OUTER SELVES

We begin closest to home, with ourselves, for everything else grows from here. What does it truly mean to be human? Are we only biological machines, or something more sacred? Before we can understand society, we must understand the one living system we each carry, the body, the mind, the emotions, the spirit, not as separate parts, but as one whole.

Mind, Body and Spirit

We are born with miraculous bodies, complex minds, and luminous spirits. But look at what we have done with them. Our systems now harm us at every level. Depression, anxiety, and suicide are rising. We feel numb, overstimulated, burned out, losing our connection to the sacredness of simply being alive. Our minds are full of noise; our spirits are forgotten. We wake

tired even after sleep; our backs ache and our minds spin and our hearts feel empty in the middle of a crowded day; and more and more people take pills just to smile, to sleep, to focus, to stay sane. We have accepted, as normal, a life lived disconnected from our own bodies, our own breath, our own truth.

We have forgotten what the body truly is. We treat it as a container to be decorated, a machine to be optimized, a tool to earn with. But the body is not a machine; it is a living library. It remembers. Every cell holds stories from thousands of years. Our bones are made of the mountains, our blood flows with the memory of rivers, and our breath is the same breath that once moved through the lungs of ancient trees. We came from the chemicals and elements of nature itself, and to nature we will return when we decay. And what do we feed this living library now? Packaged chemicals, rushed meals, stress before sunrise, screens before sleep. We sit more than we walk. We breathe more plastic than prana. We lose all awareness of the body until it screams in pain.

And the mind was meant to be a sky, open, infinite, playful. Unlike the body, which is bound, the mind can fly like a ray of light; it can reach the ends of time and space and pass through any cage. But now it is crowded with noise, with endless notifications and deadlines and fear and confusion. We overthink, overwork, and overanalyse, but rarely understand. We are trained to memorize, not to imagine; to obey, not to reflect. We scroll to escape silence. We do not let the mind think, or solve, or rest, or even grow bored. We chase goals while feeling empty, knowing deep down that something is missing, and,

not remembering what, we fill the hole with hobbies, ideologies, drugs, movies, sport, celebrity, or religion, and pretend we belong to some group so as not to feel alone.

But we are not born this way. A child is born curious, sensitive, and free; the body moves with joy, the mind asks endless questions, that energy shines without needing permission. It is the failing systems, school, work, social pressure, that slowly cut us off from this natural self, until we forget how to feel, and call that forgetting “growing up.” To be human is not just to walk upright and earn a living. To be human is to remember the sacredness of being alive: to listen to the rhythm of the breath, to follow the guidance of the gut, to trust the fire of the heart, to hold body and mind and spirit in one harmony, to reconnect with nature, and to build the future for those who come after. If we do not use what we are made of, we will only dull and degrade it. We must exercise it, sharpen it, and pass it on, our health, our knowledge, our very genes, in the best condition we can, as our gift to our children.

Health, Food and Medicine

Are we truly listening to the body’s wisdom, or have we handed our health over to industries that profit from our sickness? Why do we call it a healthcare system when it earns the most when people are ill? Why are children getting sicker and younger? Why do hospitals feel more like factories than places of healing? And why is food, the most basic medicine of all, now the thing that is slowly killing us?

Our health is not failing because of fate. It is failing by design. From the moment we are born we are surrounded by toxins, in the air, the water, the food, even the emotions around us. We are fed plastic-wrapped meals made in machines, not kitchens; vegetables grown in poisoned soil; milk from animals that have never seen the sun. We are encouraged into cities, far from nature and home and family and real food, into comfort and luxury that quietly weaken us, until we would rather ride one minute than walk five. Diseases do not come overnight; they are the piled-up consequence of a lifestyle. If you never move your body, sharpen your senses, or rest your mind, if you wake, rush to work, eat whatever you find, and sit all day in a chair, what are you doing to yourself? Even a car needs rest and good fuel and maintenance. Even a machine needs care. So do we.

And the deepest strangeness is this: in a world where every body, every mind, every plant and food is different from every other, how can there be one synthetic chemical formula, one medicine, meant to fit every human body the same? It is a joke to nature. In Ayurveda and in the ancestral systems, food was always the first medicine, not mere fuel but a pack of living information from the earth. Plants are intelligent in ways we barely understand; they read the water and the soil and the sky, they sense the coming seasons and diseases, and they store those messages in their roots and leaves and fruit. When we eat local, seasonal, natural food, we come into rhythm with the wisdom of the land and are prepared for the very changes it is facing. The modern medical industry rarely honours this. It treats the part and never the whole, the symptom and never

the root, and, worst of all, it separates us from our own responsibility. Have you ever once been told by a doctor to change your food, your work, your place, your way of living? True healing begins with reconnection, to the body, to the earth, to the food that comes from it. We must move again, breathe again, eat real food again, and stop outsourcing our health to those who do not profit from our wellness.

Family, Love and Relationships

How much of what we call love is truly unconditional, and how much is expectation, or control? Are we raising children to be free and self-reliant, or only to fit the very system we ourselves question? Our sense of connection is breaking down. Families are fractured, real community has become rare, and loneliness is everywhere; children feel unseen even inside their own homes, parents feel unsupported and burned out, elders are neglected, and friendships grow more virtual than real. The very existence of orphanages is a wound that tells us something has gone wrong.

So we must ask what family even is. Is it only blood, or can it widen to hold community as family, the earth as family, life itself as kin? And what is love, really? To pamper someone and give them everything they want, is that love, or is it making them dependent, stubborn, and greedy? To tell someone they are doing fine when they are not, is that care, or cowardice? True love is not only soft words and comfort; it is presence, responsibility, challenge, and honest care. It means raising children to be strong without hardening their hearts, teaching them not merely to succeed inside a system, but to know

themselves, to question, to explore, and to grow their own gifts. Yet what do we so often give them instead? A toxic education, addictive food, inherited trauma, and emotional manipulation disguised as duty, so that children are raised to complete their parents' unfinished dreams rather than to find their own, and partners expect one another to heal wounds they have never faced.

It should not be so. When a child is born, our task is to protect and guide and feed and nurture, and above all to make them capable of standing on their own: to give them a fresh and healthy earth to begin on, to teach them their own body and mind and soul, and nature and food and the tools of life, as early as we can, so they can begin to explore for themselves and to care for themselves and others. And then, at some point, we must let them go, free, while we return to our own lives and our own growth. A family is not meant to be a prison or a performance; it is a garden, where each one is helped to bloom in their own time, where roles keep changing, where elders share wisdom and children teach joy, and everyone is at once a student and a teacher. And if the whole family holds one common goal and works as a team, sharing the roles and the load, that is the strongest thing of all. When families become sacred again, communities begin to heal, and we remember that we belong, to one another, and to life itself.

Art, Media and Culture

What is art for, if not to reflect the truth and to deepen our connection? How much of what we consume as culture truly nourishes the spirit, and how much is built only to distract us

or to sell to us? Every human is a living artwork. The way we speak, walk, smile, cry, and dream, all of it is expression, all of it is art. The body itself is an instrument, and, like a guitar, it can be played beautifully or badly. My own life is art, the way I have lived and seen the world, the way I am writing this, the way I am building this project. Everyone is a unique piece of art, born of nature and of themselves, and people must come to feel this, to cherish it, to stand in it with confidence and pride.

But in this system, art has been captured. It has been narrowed to painting and music and dance and poetry and acting, and then handed to the media industries, reduced to entertainment, and sold like any other product. Now celebrities are treated like prophets, and artists must play roles just to stay visible; the media, instead of informing and inspiring, distracts and divides, feeding on our attention rather than our awareness. The cost is real: our ability to tell our own story is shrinking, our imagination is outsourced to screens, and our sense of who we are is shaped by filters and algorithms and influencers rather than by inner wisdom or ancestral memory. We are raising whole generations to consume far more than they create. True art was never about fame; it is about feeling, about turning the unseen into colour and movement and sound, about helping us heal and question and reconnect with the sacred. We must remember how to create again, not for likes or money, but for truth, for joy, for life.

Addiction, Purpose and Identity

What are we truly addicted to, beyond the obvious substances and screens? Is it comfort, approval, the avoidance of deeper truths? And if our purpose is defined only by outer success, what happens to us when that success crumbles? We are taught to believe that our identity comes from what we own, what we consume, or the role we play in society. But how much of that identity is only a mask, built from other people's expectations and society's pressure?

The endless chase for convenience has quietly eroded our capacity to learn, to evolve, to find any real purpose. The system keeps us busy, distracted, and running after things that never fulfil us, and so we are left with a deep inner emptiness and a spiritual confusion we cannot name. Ask honestly what is driving you: is it greed, scarcity, fear, jealousy, the hunger to possess, the wish for revenge? Or is it hope, courage, curiosity, a real dream? To live from an inner purpose rather than from outer validation is to begin to come home to yourself, and to reclaim your time and your attention from all that pulls you away from your deepest longing. We are losing ourselves in the game. It is time to remember that we were never meant to be players in it.

II. SOCIETAL STRUCTURES: HOW WE ORGANIZE OUR WORLD

Now we widen the circle, from the self to the ways we live together. But notice something first. We cannot truly understand society until we understand the human being, and we have no system, no education, that teaches us how a hu-

man even works, how our own mind and body and soul function, let alone how to feel and understand another. How, then, are we to understand our bond with one another? See the failing mechanic here. We are meant to learn our own selves first, how nature and season and food and the stars and our own age move through us, and only then to build a society that can hold us all. What follows is what we built instead.

Religion, Power and Division

Why do we still kill and divide in the name of God? Why is faith used to control rather than to connect, and why are the ancient spiritual truths buried under rituals and rules and fear? Religion, at its root, was once a bridge, a language for speaking with the divine, a practice for aligning with nature, a way of remembering our place in the cosmos. But most of our religions have been captured by politics and power. Instead of nurturing awakening, they demand obedience; instead of welcoming questions, they threaten punishment; instead of honouring difference, they impose a single identity. And so, in the name of God, we have made wars, castes, the suppression of women, and cycles of guilt and shame passed down for generations.

But the spirit cannot be owned, truth cannot be institutionalized, and love cannot be legislated. We do not need to throw everything away; within every tradition there are seeds of real wisdom, for each one points, in its own way, toward the same reality. The problem was never prayer; it is hierarchy. The problem was never belief; it is control. Every religion holds a piece of the truth: one begins its explanation from the leaf, an-

other from the root, another from the branch or the fruit, but they are all describing one tree. We must find our way back to the sacred, then, not by choosing one religion over another, but by seeing the single thread of life and light and love that runs through them all.

Economics, Work and Labour

The way we earn, spend, and measure success is broken. Our economy puts profit over purpose, and from that one choice almost everything else rots. Money has become the first priority of life and all else is secondary, and so every sector grows corrupt: business and showing off and buying power, greed and propaganda and false idols, poverty and class and race, the possession and destruction of nature for profit, poisonous farming and polluting machines, people leaving their families to earn, doing work they hate, human trafficking, the drug trade, and news and knowledge shaped by whoever pays for the advertisement. Everything, in the end, connects back to profit. People work long hours at meaningless jobs, making things nobody needs, to buy things they cannot afford, to impress people they do not even know. This is not freedom; it is a modern slavery in a suit.

And underneath it all lies a manufactured scarcity. When food is scarce, fear arises, and from fear people grab and hoard and make foolish, desperate choices just to survive. But the scarcity is a design, not a fact. There is land enough, and there are tools enough. If we used our technology to cultivate the world's land, food would become abundant, the fear would lift, and the whole logic of a profit economy would fall away. We

could try other ways: a resource-based economy, a technology-based economy, a time-bank, an intelligent barter. You may say barter fails because it is hard to trade what each person makes, but if our machines produce what is needed, gathered in shared places, with the data open to the whole world, then we could see what humanity actually needs and produce it, through technology and automation, for everyone.

This asks something of us. It asks leaders and engineers and ordinary people to see the vision and to work, for some years, even for decades, without money, sacrificing immediate gain to build the infrastructure of a better future, while those who are not builders sustain them with food and clothing and love until it stands. And once it stands, the work can become voluntary and educational: some come to run a system for a few years while they learn, then move on, and others come to improve it, and so it grows. Humans need to work, to create and serve and build; that is not in question. But work without meaning is suffering, and work that destroys the planet or numbs the soul is not true work at all. No system that normalizes burnout should ever be called a success. The real purpose of our labour is to build a better, healthier, wiser life for what is coming, for humans, for nature, and for the tools we make. It is that simple.

Leadership, Politics and Governance

Governance was meant to be the art of serving life, of guiding a society toward wisdom and balance and the protection of the vulnerable. What we have instead is bureaucracy without soul, rules without rhythm, and courts without compassion. Most

political systems today run on old power games built for domination, not cooperation, and leaders are chosen not for their wisdom or their moral clarity but for their money, their image, and their skill at moving a crowd. So we get governments that manage the symptoms and never touch the root, that think only of the short term, that hold power without accountability, and a democracy that too often feels empty, leaving people hopeless rather than able to act.

Look honestly at the leaders around you and ask whether you feel truly represented, or whether they serve some other interest. And then ask the deeper question: if every human is capable of leading their own life, why do we surrender so much of our power to so few? To me, a leader is meant to unite people toward a common purpose, and to move us all toward freedom and shared knowledge and a better future. But better still, every human should be raised to be a leader of their own life, able to understand themselves and others and nature and the tools of the age, able to grow food and protect a family and think for themselves and act for the common good, not to follow another like a sheep or feed on another like a leech. We must shift from a system of power over to a system of power with, where leaders are the true servants of the people and the earth, and where governance bends to nature's laws instead of trying to conquer them.

Law, Ethics and Justice

And our law? Our legal systems are built for punishment, not for healing. They criminalize poverty and protect corruption, punishing those who are only trying to survive while the pol-

luters and the warmongers and the billionaires walk free. In too many places the police no longer feel like protection but like a threat. What would law look like if it were built on truth and healing and responsibility, instead of on control?

Let me tell you honestly how I have come to see right and wrong. The cosmos does not favour one thing over another; it simply flows, as it has for billions of years, as nature does, indifferent to what goes extinct and what emerges, mixing what it has and making something new. It is all adaptation, all movement, and some of the old texts say the same. And it is out of this that I have found my own purpose, and a meaning to being human. For with the right tools and skills and knowledge, we, who can think and remember and judge and imagine and plan and design and build, are very nearly what the old books called gods, beings who could shape the fate of the cosmos itself, if only we would fix our systems and our way of living.

So in a human world, I believe we made law for one simple reason: to protect ourselves from extinction. The principle is simple. If an act endangers human life on this earth, it is a harmful act; if an act helps humans evolve into better beings, it is a good one. All that remains is to widen that vision, to include nature, the earth, the animals, the plants, and the cosmos, so that as we think and choose and design and act, we take care never to degrade anything that will, in the end, degrade us too. For we are all connected. We share the same life, the same air, the same water and heat and land, with everyone and everything.

Education and Knowledge

Does your education truly prepare you for life, or only for a job inside the current system? Do you come out of it wise, or only overwhelmed with information you were never taught to understand? Why is the knowledge of our own body and mind and spirit not the very first thing we learn? The laws of nature and mathematics are universal, and nature's patterns are free, so why is real wisdom not free and open to every human on earth? Why do we not teach how the elements and the food and the seasons and the stars move through us, or how to use our tools to grow food and travel and learn freely?

And why must a single school system be the sole keeper of all learning? Where did this model even come from, if not from the age of colonization and its wish to school the whole world into obedience? Why are different histories and religions and skills taught in different places, from different books, if not to serve a profit-driven design? What are we training humans to become, machines, factory workers, holders of jobs? Why are the same lessons poured into wholly different souls, and why has the shape of a school barely changed in decades? We reward memory over imagination and quietness over courage; we teach history as the victors wrote it and ignore the wisdom of the earth and our ancestors and our own inner voice; we push children to chase degrees instead of dreams, to fear failure instead of learning from it, to compete instead of cooperate. Is it any wonder they grow up lost and anxious, without purpose or self-knowledge?

Education truly begins at birth. The parents are the first teachers, then the relatives and friends, the community, life itself, and only then the school. Yet the parents were never taught the things that matter, their own body and mind and soul, their bond with nature, what health is, what food is, what history has to teach, and this system keeps them so busy that they have no time to learn it, or even to sit with their own children, and so they hand the child to a stranger to be taught how to live. How, then, will that child ever feel love and belonging and responsibility toward family and community? I dream of something else entirely: the whole earth as the school, every community a classroom, all knowledge gathered from real, working people. Learn yoga from a yogi who practises it every dawn; learn farming from a farmer in the next valley; learn science from someone who lives it in another city; learn life itself by travelling and living among many communities, not by sitting twenty years inside one box and coming out still lost. True education is not the force-feeding of facts; it is helping the soul remember, the unlearning of falsehood, the joining of head and heart and hands until knowledge becomes wisdom and wisdom becomes action. Imagine schools that taught self-awareness and ecology and design and farming and healing and ethics, children who grew up knowing how to raise their own food, build a home, hold space for grief, and love without fear. This is not a fantasy. It is what education once was, and what it can be again.

Social and Cultural Division

And over all of it lies division: by country, by religion, by race, by gender, by class. It breeds discrimination and intolerance and unfair systems, and it stops us from ever seeing one another as family. What do the lines on a map, or the labels we pin on each other, truly do for us, except divide? This division is not natural. It is a construct, and it serves one purpose: to keep power and control in a few hands, and to keep humanity from ever uniting.

What would it take to see every human as part of one global family, beyond race and religion and nation? The media and the political systems work hard, every single day, to keep us split. And the quiet, daily work of a Hunatian is to resist exactly that, to build bridges where they build walls, and to remember that our belonging to one another, and to life itself, runs far deeper than any border ever drawn.

III. NATURE: OUR PLANET AND ITS GIFTS

Now we turn outward, to the earth and to space, the seen and the unseen, the felt and the unfelt, the living and the non-living. There are, in truth, two natures: the nature of space and the nature of the earth, each built on different principles, each moving by different laws. But do we truly know either of them? Not all of us have been to space; the stories come from a handful of people who claim to have gone, and in a world driven by profit and competition and dominance, how are we to know what is true? There is still so much to discover, about nature, about how we are connected to everything, about how we truly touch the living world around us. The an-

cient knowledge seems to have held ways of understanding these connections, of reading nature and using its wisdom for the good of all: astrology, Vastu, Ayurveda, the science of yoga, these are only some of them.

Climate and Ecosystems

We are deeply harming the earth and its gifts. Glaciers melt, the seasons turn unpredictable, food chains collapse, and what we call natural disasters grow more common by the year, all of it showing how far out of balance we have pushed things. Why are we still surprised by the floods and droughts and melting ice, when we keep tearing down forests, poisoning rivers, and burning fuel as if there were no tomorrow? Why do we call it a natural disaster when it is so clearly a human one? Why do we try to fix the climate with machines, instead of changing how we live?

The climate crisis is not a mystery, and it is not sudden. It is the result of centuries of disconnection, from the land, from responsibility, from reverence. We are destroying the very systems that keep us alive: the trees that breathe for us, the soils that feed us, the insects that pollinate our crops, the microorganisms that hold the planet's memory. Whole ecosystems are collapsing, not slowly, but fast. And we call it progress. Governments make their promises, corporations sell a green version of the same destruction, but the real change cannot come from above; it must come from within. We are not separate from this crisis. We are made of it. We are the storm and the stillness both. And the earth is not asking us for pity. It is asking us for partnership.

Land, Water and Biodiversity

We are losing our natural world: vast deforestation, eroding soil, poisoned water, species going extinct, habitats vanishing. And is it not absurd? What are the grown-ups doing, the leaders, the visionaries, the priests, the engineers, the scientists? Why is everything possessed? Who owns the land, the water, the very air? Why are there borders on a planet that is one single living body? And what is a newborn child supposed to do, arriving here for the first time, by no choice of its own, to find that everything is already owned? Are they to play the same game, to carry a debt they never made, to pay for air and water and food and shelter and knowledge? These things should be free, a gift to the child, a welcome to the future. You may say, oh, they are the future, they will fix our problems. Bullshit. That is just another excuse. Why should they fix it, and how could they, when we hand them poisoned air and land and water and a greedy, profit-based system? They will become exactly like us.

When you look at a river or a forest, do you see a resource to be owned, or a living being to be honoured? Land is not dead ground. It is memory. It is mother. It is the very skin of the planet, alive with movement and feeling and intelligence. But we have drawn our borders across her, cut her into pieces, dug into her bones for profit, and called it development when it is really dismemberment. Water that once flowed freely is dammed and sold and poisoned; sacred groves become concrete; mountains are mined; the deserts spread. And with every species that disappears, we lose not just its beauty but a part of ourselves, for these beings evolved beside us, threads

in one web, and when a thread breaks the whole net weakens. Biodiversity is not a luxury; it is the foundation of resilience, for the more diverse life is, the stronger it becomes, and the monocultures and mega-farms and dams and privatizations that kill variety are killing life itself.

And with the science and the tools we already have, we could do otherwise. We could calculate every resource of the earth, the air, the water, the land, the minerals, the sunlight, and share that data openly with the whole world, and plan together how to use it and when. If the data were transparent, people would understand on their own how much to take and when to stop; they would feel, at last, the need to protect and to regenerate what is left. We must return to a relationship with the land. Not ownership, relationship. The land does not belong to us. We belong to it.

Agriculture and Land Stewardship

Our farming is broken. Industrial agriculture poisons the soil, a few corporations own the seeds, and the farmers who feed us are losing their dignity while we lose our food sovereignty. Why are we feeding ourselves food that destroys the soil and the water and our health? Why are farmers dying while the corporations grow richer? Why is food grown in poison and shipped across the world, when it could be grown in love right where we live?

Agriculture used to be sacred. It was prayer in motion, the placing of seed into soil with hope and humility and rhythm, and the farmer was a guardian of life and tradition and culture. Today it has become one of the most disrespected and danger-

ous jobs on earth. Chemical farming, pushed by governments and corporations and a false science, has destroyed the topsoil, wiped out the native seeds, and filled our food with toxicity; the water tables drop, the pesticides are in our very breath, and the farmer is trapped in a system where he must borrow to grow and is ruined if the rains do not come, while the supermarket shelves overflow and the city buyer never once asks where the food came from, or who grew it, or what price the land paid. We must return to local food, to organic and regenerative and indigenous ways, to saving seed and making compost and protecting biodiversity, and to honouring the farmer as a healer and not a mere labourer. And each of us must learn to grow at least some of our own food, even if it is only a single plant on a kitchen sill. It is not about scale. It is about relationship.

Animals and Insects

We share this earth with billions of other beings, birds and deer and worms and elephants and butterflies and whales and fungi and ants, and each has its role, each carries a wisdom, each is sacred. Yet why do we still kill and cage and exploit them when we no longer need to? Why is the meat industry among the greatest causes of climate destruction? Why are the bees disappearing? Why do we act as if we were the only species that mattered?

Modern human systems treat animals as products. We breed them unnaturally, confine them in cages, inject them with hormones, and slaughter them without pause or prayer, and we justify it all with convenience and habit and taste. The

insects are vanishing too, the pollinators, the bees and the butterflies, and without them most of our food collapses, yet still we spray our poisons everywhere, killing the very things we depend on. This is not about guilt. It is about awakening, about remembering that the animals are not here for us; they are here with us. They feel, they dream, they grieve, they belong. If we want to live in balance, we must draw all of them into our circle of care, not only the pets, but all of life.

IV. TECHNOLOGY: OUR TOOLS FOR LIFE

Now the last of our systems: technology, by which I mean every tool we use to stretch our limited senses and to grow our physical and mental and spiritual reach. Not only the electronics, but everything: the working tools and the books, the kitchen pots and the fire, the energy and the sticks and the weapons, the vehicles and the houses and the clothes and the shoes and the ropes, the plumbing and the machines and the glasses and the cosmetics and the farming tools and the packaging. Even ideas are technologies, the religious books, the political theories, the stories and the myths; all of them are tools. And the whole task is simply this: to make our tools within nature's law, eco-friendly, biodegradable, and truly useful.

Technology and Innovation

The very tools we made to help us are now controlling us, and creating more problems than they solve. What are technologies for, in the end? There is little to say about their power. They are meant to expand our human limits, to let us see the

universe in a bigger picture, to cook and to store our memories and to read our histories and to move faster, even to fly. So why are these powerful tools not being used to grow food everywhere on the earth? Does that not trouble you? Because if food were abundant, the world's people would be free: travel would be possible, a true education would be possible, and there would be nothing left to sell, no one to control, no one to colonize, no one to keep as a slave. Food is the first thing to be captured in a profit economy.

Look around. We have science enough to calculate every resource on the earth, to go to space and dive to the ocean floor, to kill bacteria and viruses, to build eco-homes and biodegradable packaging, even, they say, to cure disease. So why is there still hunger, still HIV, still cancer? Why do we not open the data and plan our cities and our land and our food together, if we are truly so smart? Because in a profit economy nobody with power wants that, least of all those who already own the land and the resources. The tools are misused, completely, and those who try to free them are silenced, or worse. Yet we could use technology to free human labour, to automate the farming and the transport and the exploration and the dull repetitive work, and so free human beings for art, for meaning, for exploration, for love. Progress is not only about what we can do. It is also about what we choose not to do.

Machines, Industry and Energy

Why do we still burn the bones of the earth to keep our lights on? Why is energy owned by a few, when sunlight falls freely on every roof? Energy is life; every breath and heartbeat and

sprouting seed is powered by it, and yet the systems we built to capture it have become among the most destructive forces on the planet. We burn coal and oil, the ancient remains of life, to light cities that never sleep; we dam the sacred rivers to fuel the industries that poison them; we split atoms for electricity while ignoring the fire of the sun overhead. And all the while we remain energy-poor, not only in watts, but in vitality, in rhythm, in awareness. Our whole infrastructure is built on pollution, our industries churning out goods with no regard for the long health of the earth or its creatures.

But energy is not only what flows through wires; it is what flows through you, through food, through touch, through silence, through love. Every being has its own current, its own charge, its own frequency, and the ancient cultures knew this and worked with energy rather than against it. We must redesign our energy not merely to be renewable, but regenerative, solar and wind and water, yes, but also rhythm and rest, and we must decentralize it, from the corporations back to the communities, from the outer machine to the inner movement. Because energy is not just what powers our devices. It is what shapes our lives.

Media, Internet and Social Platforms

Why is the world more connected than ever, and yet we feel more alone? Why do we spend hours scrolling and clicking and reacting, and forget how to sit in silence or to truly listen to another soul? Why are we trading truth for trends, and wisdom for content? The digital platforms have changed everything, how we learn, how we speak, how we remember,

and while they offer immense possibility, they carry a deep cost. The algorithms are not neutral; they are built to hold our attention by any means, and outrage and fear and comparison and seduction are the currencies of this age, for the more triggered you are, the longer you stay, and the longer you stay, the more you are sold.

So we live now in echo chambers, surrounded by our own opinions, cut off from complexity; information is no longer about truth but about engagement, and even the news has become a performance. And what happens to the soul in all this? It grows distracted, overstimulated, confused, lost. We forget how to be bored, how to be still, how to feel a thing without broadcasting it. But the problem was never the tool; it is how we use it. The internet can be a great teacher or a great thief, it can connect or divide, awaken or numb, and which it becomes depends entirely on who we are choosing to be.

Medical Technology

We lean too heavily on medical technology, over-medicalized, over-priced, over-dependent on chemical drugs, and good care is hard to reach for anyone without wealth. Medicine has worked real miracles, the surgeries, the scans, the emergency care, but the system that delivers it is broken at the root, for it profits most when we are unwell. It ignores the true causes, the stress and the trauma and the food and the pollution, and reaches instead for temporary relief; it suppresses the symptom while the imbalance keeps growing; and its mass-produced drugs are cut off from the life force of real medicine,

while the wisdom of plants and ancestral healing is dismissed or sold. The patient becomes a customer. Healing becomes billing.

And most dangerous of all, we have been trained to out-source our health entirely, to wait for the crisis rather than to live in alignment. But health is not something handed to us; it is something we cultivate. A truly healthy society would teach its people how to eat, how to breathe, how to rest, how to grieve, and how to grow, and a truly healthy system would treat the whole being, and not just the broken part.

Waste, Plastics and Toxicity

Where does all of it go, when we throw it away? Why do we still wrap everything in plastic, knowing it will outlast us by centuries? Why is it cheaper to make something new and disposable than to reuse what we already have? We are choking the planet on our own convenience, single-use products, fast fashion, electronic junk, packaging that lives longer than the thing inside it. Our oceans hold islands of plastic, our soil is laced with chemicals, our cities make waste faster than we can bury or burn it, and still we produce more.

Recycling is not the solution; it is a story we tell ourselves to feel less guilty. The real problem is overproduction and overconsumption, and a culture that values the new over the necessary. But nature makes no waste; in a natural system, everything is reused, composted, transformed. We must learn that rhythm again, and design systems where nothing is left

behind, where beauty and use are joined, where consuming is a conscious act. We do not need more landfills. We need less landfill thinking.

Transportation and Urban Systems

Why do we spend hours in traffic just to reach jobs that exhaust us? Why do our cities grow taller while our sense of community shrinks? Why have noise and pollution and speed become the normal condition of a modern life? Urban design was meant to support life, but most cities today feel like machines for movement rather than places for belonging: concrete dominates, trees are decoration, the walker is an obstacle, and the faster we go, the more we lose all touch with where we actually are. Our transport, built on fuel and friction and fumes, is among the largest drivers of climate change, and yet we keep building flyovers instead of fruit forests, highways instead of harmony.

People lose hours to the commute, hours taken from family and stillness and the self, and return home to small boxes stacked upon boxes, ringed with noise, with no land to touch and no food to grow. We must rethink what movement even means, not just mobility but purpose, not just speed but direction, not just arriving but arriving whole. Cities can be gardens. Roads can be sacred paths. But only if we redesign them from the ground up, with the soul in mind.

V. UNDERSTANDING OUR PLACE: PAST, PRESENT AND FUTURE

F

inally, we come to the largest frame of all: our place in time, and in the cosmos, where we came from, where we stand, and what we will leave behind. For a people cut off from their true past cannot imagine a true future, and a species that forgets it is a small part of a vast, living universe will always mistake its own greed for greatness.

History, Myths and True Narratives

What if the history we were taught is not the truth, but only a version of it, curated by power? Why do we know the names of the conquerors but not the wisdom of the healers? Why do our textbooks begin with kings and wars and empires, and leave out the people, the forests, the rivers, the grandmothers? History is not simply what happened; it is how we remember, and what we choose to forget. Colonial and patriarchal and capitalist powers have written most of what we call history: they erased the indigenous stories and the spiritual revolutions and the feminine wisdom, turned whole complex cultures into a timeline of rulers and battles, and made memory itself a weapon. And when a people lose their real history, they lose the power to imagine anything different.

We are raised on myths of heroism that glorify violence, told that to be civilized is to leave nature behind, taught that science and progress began only a few hundred years ago, when in truth people lived in advanced and harmonious and sacred ways for many thousands of years. Every human coming to this earth should have free access to the true story of this world; how else can we plan a future, or fall in love with our own evolution, or find any real purpose? So we must begin

again, dig deeper than what we were handed, and listen to the voices that were silenced. The earth remembers. The body remembers. Your soul remembers. History is not only behind us; it is inside us. And only when we reclaim the truth of our past can we build a future worth living in.

Religion and Spirituality

What if the greatest truth is not found in a temple or a textbook, but in the silence of your own breath? Why do we search outside when the voice within has always whispered? In the rush of modern life, spirituality has been either institutionalized or sold: on one side a religion that demands obedience and breeds division, on the other a consumer spirituality peddling retreats and crystals as shortcuts to peace, and both, so often, miss the essence. True spirituality is not something you buy or borrow; it is your birthright. It begins with presence, with observation, with humility, the slow unraveling of illusion, the remembering of who you really are.

Every human carries an inner compass, a quiet knowing, but we are taught to ignore it, to override it, to distract ourselves from it, because we fear being alone with our own truth. Yet the real journey begins only when you turn inward, when you meet your emotions as teachers and not as problems, when you feel energy not as a metaphor but as a reality, when you treat every plant and person and moment as sacred. This is not about dogma; it is about remembering that you are not just a body, not just a role, but a spark of the infinite walking in form. And when enough people awaken to that, the world itself begins to change. One does not need a god to wor-

ship from the outside; one has to become god, to embody the very qualities the sacred texts describe, and this, too, must begin again with the parents, with the community, with the way we raise a child from birth and from home.

Aliens, the Cosmos and the Unknown

Why do we act as if we were the only intelligence in the universe, when we do not even understand our own ocean? We are stardust walking, born of explosions, forged in silence, alive in a universe so vast we cannot begin to comprehend it, and yet so many of us live as though the world ended at our country's border, our religion's book, our city's skyline. But there is more. So much more. The cosmos is not empty; it is alive with intelligence. Some call them gods, some call them energies, some call them extraterrestrials, and we do not have to agree on the word, but we must remain open, for arrogance, not ignorance, is the real danger.

And it is here that I return to the old question of where we came from. Perhaps we were once far greater than we are, when the earth's air and seasons were different, our food powerful and natural, our senses sharper, our minds able to think and dream and analyse far beyond us now, thousands of years before this recovered and corrupted history, and our ancestors were the ones who truly studied the world and wrote those first great books in a language more advanced than ours. Perhaps we came from elsewhere, travellers from a more advanced civilization who started a new life here. Or perhaps we rose to a great height on this very earth, cracked the codes of the atom and of space, and were then wiped nearly clean by

some great disaster, and have had to begin again from nothing. I do not know which is true, and in a world where knowledge is possessed and history is erased after every war, the truth is hard to reach. But I know we must keep our minds and our search open, with humility and curiosity, in a return to cosmic awareness, for we are not merely citizens of the earth. We are participants in a much larger story, and the sooner we remember it, the wiser our choices will become.

War, Borders and Power

Why are we still drawing lines across the earth and killing one another over them? Why are men with money and missiles allowed to decide the fate of millions? Why do we worship flags more than we protect forests? Borders are imagined; the earth does not know them. Rivers cross them, birds ignore them, seeds need no passport. But we humans build the walls and invent the enemies and train our children to salute a cloth before they have even learned how to love, and in the name of safety we build arsenals large enough to destroy the planet many times over. War is not only violence; it is business, feeding industries and governments and egos, robbing from the poor and the peaceful, and creating a trauma that lasts for generations. And power, once cut off from responsibility and heart, always corrupts.

All of this is a byproduct of the profit economy and of a few who are hungry to hold their control, a pattern passed down through the generations until certain families and groups are simply conditioned to seek and keep power. It is not a conspiracy; it is an inheritance. Imagine you were born into a ruling

family in some age. What would you do to keep that power alive? You would build a system, the education and the economy and the politics and the army and the media and the control of food, all shaped to keep you where you are; you would teach your own children the necessary knowledge from birth; and why, truly, would you care for the ordinary people, when you have never lived among them, never eaten their food or done their work? Before colonization there were no such borders. People had their representatives and their kings, but those leaders were far closer to the people and the land. If this scarcity system were gone, we would have no need of war, or borders, or that kind of power at all. And so, if we want peace, we must move past the politics of fear, and grow leaders who listen more than they speak, who protect life rather than their own position, who believe in bridges more than in bombs.

What We Leave Behind

What are we truly passing down to our children? Clean air, healthy soil, living rivers? Or confusion, anxiety, and a collapsing world? Every system, every decision, every way of living leaves its footprint on the future, and right now those footprints are deep and dangerous. We are exhausting the planet, poisoning our bodies, breaking our relationships, building technologies we do not know how to control, and raising whole generations cut off from land and story and soul. This is not a judgment. It is a wake-up call. For the most sacred re-

sponsibility of any generation is to leave the earth better than it found it, to pass on beauty and not just buildings, wisdom and not just wealth, health and not just hospitals.

The children of tomorrow will not care how rich we were. They will ask: Did you fight for clean water? Did you plant trees? Did you speak the truth when it mattered? Let us live so that we can answer yes. Let us live so that something sacred is left behind. And so I invite you, at the end of all this, not only to criticize, but to truly see, to remember what has been lost, and to begin again. Let each of these broken systems be a mirror. Add your own story to it. Speak your own truth. Begin the healing. This is the first step of becoming Hunate.

We Are Supporting It: This Failing System

And here is the hardest truth: we are all supporting this failing system. We were born and raised inside it, and so most people will never even see it; we live our whole lives as if this were the only way to live, and we are kept too busy ever to notice.

In a profit economy, the central purpose of life has quietly become to earn money, and everything is built around it. From the very start we condition our children to fit the system: we teach them to earn and to follow orders, we feed them food from factories without knowing what is in it, we send them to schools without understanding what they should truly be taught, we hand them screens without watching who is shaping them from behind the glass, and we press them to earn before they have understood life at all. We brainwash them so

hard and so early that, by their teens, they run on their own as programmed, following the same system and passing it to the young ones after them, becoming its tools in turn. And this system does not even teach the truth; it does not teach us where we are, this earth, or what we are made of, this body, or how the food and the seasons and the stars move through us. It teaches only how to dream, quickly, of money.

A few wake up and decide to grow above the greed, and some join the NGOs and the non-profits, working with children or animals or the climate, hoping to make their lives mean something. But knowing it or not, we fall into the same trap. We rescue the animal and then cage it and feed it food from the same broken chain; we use the medicines and soaps and vehicles and clothes of the same mega-corporations; we eat from the same food chain, watch the same screens, send our children to the same schools, and press them, in the end, toward the same jobs. See how vast this thing has grown, and how everything connects to it, until it feels as if there were no escape, every step and every choice quietly feeding it. The villager wants the city he sees in the films; the farmer, the teacher, the engineer, the doctor, all fall into the same trap without ever realizing it.

So think, honestly, for yourself: are you awake? Even if you are doing good, look again at where you are standing, and where your efforts truly land, and look from many angles. There are a few families and projects and communities who have stepped completely out of the failing system, who weigh every part of life carefully, who grow fresh organic food and use eco materials and live in peace and use their tools ethically

and wisely. Hunate strives to be one of these. It takes hard reflection and healing, a rewiring of a brain long pre-conditioned; it takes discipline and sacrifice and commitment and a strong sense of ethics. For we were taught to be afraid, taught to live in scarcity and possession and consumerism, and we cannot easily leave the comfort zone; we are manipulated constantly, and we live in a cage, believing all the while that we are free.

Whom to Blame: No One

When we look at all of this, the temptation is to ask: whom do we blame? But the answer is not simple, because we exist inside a vast, many-layered web, and, knowing it or not, we built this failing system together.

The story we are taught is one of steady progress: millions of years of evolution, stone and then fire and then iron, community and agriculture, religion invented to explain the rain and the thunder and to organize us, armies to protect the rulers, and then science and mathematics and the tools that let us do what once seemed impossible, even to fly. But there are other stories too. Many ancient books speak of highly advanced beings, sometimes called gods, who came and gave us our systems of community and work and belief and farming and governance, and knowledge of nature and the cosmos. If that is true, where is that knowledge now? Who took it, and who hides it? It becomes clear when you look at the world today: such knowledge could never be shared openly, for it

would truly free us, and then there would be nothing left to sell, to control, to dominate. Those who hold power understand this simple thing, and they do not give power up.

There are many such narratives, and small pieces of truth scattered across the earth, hidden in the myths and the scripts, the detailed Sanskrit texts of ancient India, the richness of China and Africa and Egypt, but the system we live in will not let us gather and share them, because we are all competing for power and profit and control, and in that fierce competition the stronger nations keep exploiting the weaker, and much of history was rewritten by the conquerors, the old scripts and cultures destroyed in the name of colonization and war. Everyone is afraid of being controlled, and so everyone keeps fighting. It is stupid. We are driven by possession and greed and control and fear, and these traits live in our brains; they helped us survive the jungle, they helped us grow, but we are no longer in the jungle fighting merely to survive, and it is time to choose to grow above our old instincts, and to evolve into higher beings.

So there is no single one to blame, no particular person or country or race or era or religion or industry. It is all the byproduct of how these connected parts have shaped one another over long time. Every system we have, in its current form, is a failed system, and in the very name of development and progress we have unknowingly built ourselves a cage, a failing social system that limits our potential, cuts us off from nature, and endangers our future.

If We Continue: We Are Doomed

And if we continue like this, nothing will happen to the universe. Humans will simply go extinct, and no one will care. The universe and nature do not care; they have been creating and mixing and destroying and moving on for millions of years, each with its own intelligence, its own way of flowing. It is only we who cannot let go. We will fight to survive, as every animal does. But even if we find a way to survive, in what form will we survive, as a lowly creature, or as high, godly beings? That is our choice.

For if this failing system continues, we will keep degrading ourselves at the deepest level, and drag nature and all life on earth down with us. We are not as smart as we claim; we are growing weaker, sicker, dumber, and greedier, and none of our systems, not how we teach the young, nor how we govern the land, nor how we heal the body, nor even how we entertain ourselves, truly serve the health of humans, or nature, or the future. Above it all sits the profit economy, where the whole purpose of life has become to earn, at any cost, a thing built on scarcity and possession and control and power and greed and fear and ego and war. Who knew we would become the slaves of our own creation? We thought we were developing, and we forgot our roots; we began to consume the very earth that keeps us alive, in the name of business and science and development; we grew too greedy, and let success and happiness be redefined by status and class; and we forgot our purpose, forgot our bond with the cosmos, forgot everything, and drowned in our own poison.

What Then: The Time to Change

So we must stop. Take some time to breathe, to slow down, to look back at life. It is time to redesign this whole human system from the root, and this time not to earn profit, but to heal, to cooperate, to evolve. It is time to look inside ourselves and to sort, for a while, what is desire from what is want from what is truly need; to filter out the dreams and purposes and passions that this manipulative system installed in us; to rewire our thought and our habits, to clear away the expectations society has pressed upon us, and to take our lives back into our own hands.

This is why Hunate was born. It is a new way to live, a lifestyle for rethinking and redesigning and rebuilding our social system from the root. It is a project, a movement, a philosophy, a way of researching and reflecting and observing and exploring and understanding and restructuring how we live. Its purpose is to restore the harmony between humans, nature, and technology, anchored in ancient wisdom and lifted by ethical innovation, to spread awareness and to design a future rooted in research and understanding and sharing and regeneration and service to all life. Hunate was born to help us become the best version of the human, while caring for the place we live upon, the earth, and using our tools to hold the balance and harmony among humanity, nature, and technology itself. Simple.

THE HUNATE BOOK

Hunate: A Way to Live

HUNATE simply means this. **Hu**, for humanity. **Na**, for nature. **Te**, for technology. And it means the three of them learning from each other, understanding each other, connecting and bonding with each other, living for and supporting and depending on and helping each other, balancing and maintaining each other, and, in the end, elevating and evolving each other. Simple.

Hunate does not begin with answers. It begins with the questions you have already heard throughout this book, why we live as we do, why we harm the very things we love, why we accept a world that does not work. And the answers we are looking for are not handed down from any authority; they are found, each of us, through our own exploring and observing and reflecting, and then shared freely. What follows, then, is not a doctrine to obey, but a way to be human, and a picture of the world that such a way could build.

A Way to Be Human

Modern science and technology, meant to enlighten us, are not truly free for ordinary people. The knowledge is capitalized and, in many ways, kept from public use; a few hold the data and the science and the tools, and they hold the knowledge,

and knowledge is power. And though much is freely available online, it is so polluted and confusing that it breeds more mistrust than liberation. Try to understand your own body, or the effect of a certain food or water or colour or climate, and you will find a thousand voices, each certain it is right, until you are left more confused than when you began. It should not be this hard to understand ourselves. We have tools to travel in space and to print DNA and to scan the whole earth, and yet this most essential knowledge is not open to us, and there is no single trusted place to find the truth, because every scientist and doctor and engineer is, in some way, possessed, capitalized, or controlled.

And yet many ancient cultures already understood the body and nature and space, each in their own way, though language loses its meaning over time and much of that wisdom has been misread or buried by the modern system. The knowledge held in yoga and meditation and Ayurveda is founded on nature itself, and it is mocked by the modern world only because it does not fit its narratives and its markets. So for a Hunatian, the work is to build one's own way of knowing, through self-exploration, self-observation, self-reflection, self-analysis, self-experience, and one's own intuition, until one becomes truly self-reliant in the search for truth. You can practise this daily: by keeping a journal, reflecting on your facts and emotions and dreams, on the food you ate and the season and the weather and the movements of the planets and the events of the world and the day; by pausing to reflect in

the middle of the day; by taking a quiet time in the morning to observe, and a quiet time at night to look back. Consider yourself a wonder, an explorer, a researcher, a student of life.

And understand this: almost every experiment done on humans, on our food, our medicine, our children, our minds, is subjective, done in a controlled place for a short time, by someone else, somewhere else. It is not you. Human life is not the result of a closed box and a fixed span of time; we are connected to billions of years of data and evolution. Every life, every moment, every climate and day and person and place is different, and produces a different result. So each of us carries a unique body and mind and spirit, a unique bond with nature and the cosmos, and each of us must find our own truth to live by. As I have come to say it: if you are agitated, watching someone else sit in peace may help a little, but it will not make you calm; you must learn to be at peace yourself. Someone else eating food will never fill your own hunger.

Our Vision

We envision a future in which humans, nature, and technology do not merely coexist, but flourish together in a deep harmony. It is a world where humanity has embraced its identity as one interconnected family on a single planet, beyond all the outdated divisions, where technology serves to help us understand life, to bond with nature, and to share its resources fairly, and where every human works to build a healthier, wiser, more abundant future for the generations to come.

The Progressive Human

In this future, humanity walks a continuous journey of learning and self-improvement and shared responsibility. People pursue knowledge and wisdom and growth all their lives, always studying and reflecting and exploring and seeking the truth across many fields, and so adapt and evolve in a changing world. They become awakened, self-reliant, multi-skilled, and independent, living with purpose, caring for their physical and mental and spiritual bodies from birth to death, and tending their senses as the very gateways through which they meet the world. They expand their concern beyond themselves, weighing the good of others and of nature and of the future in every choice, striving each day to be a better version of themselves and to leave things better for the ones who follow. They see every fellow human as friend and family, dismantling the false divisions of race and nation and belief, and hold themselves as citizens of the earth, seeing the earth as one country. And they use their technology only ever to keep the balance among self and nature and future, as a tool for integration, never for dominance.

Nature, Our Sacred Foundation

In this future the earth and its ecosystems are being restored to health and treated with reverence as our first source of life. The natural resources are shared equally among all beings, human and animal and plant alike; nature is taken as the base of every invention and every building, so that what we make blends into the living world rather than fighting it. We study

the land and water and air and climate and the resources beneath and the seas and the sky, and share that knowledge openly with the whole world as one country, so that all can see how much to use and what to leave. We live within nature's rhythms and its limits; our farming becomes regenerative, our food fresh and abundant, with food plants growing freely wherever they can; the land grows fertile again, the air and water clean, until nature is providing enough for humans and animals and the earth and the future alike.

Technology, a Harmonizing Force

And in this future our tools are made and used ethically, to serve life and deepen harmony rather than to dominate or destroy. They are built on natural laws, so that every advance is sustainable by design. They draw free energy from the water and the wind and the sun and the vibrations of the world, and help make the earth abundant with food, so that no one goes hungry. They research the past and store the knowledge and share it as a true and open education for everyone on earth as one family; they help solve our diseases, help us understand ourselves and one another, help us protect and restore the living world. They free human travel and connection across the whole earth, balance the resources against real human need, build homes for both people and nature from natural materials, and help nature and humanity live joined together. Above all, they help us build a resource-based way of living, one that needs no profit or greed or ideology or border to function, that helps us shed possession and poverty and war and useless power, and that creates, on this earth, the conditions in which

a human being can finally embody their highest self, and evolve, together with nature, into something wiser than we are now. For the true liberation and the true abundance arise only when these three, humanity and nature and technology, are held in balance.

Our Mission

Our mission is to explore, to understand, and to reveal new ways of living that heal the disconnections we now live inside: the disconnection between humans and their own true nature, reconnecting each person with their mind and body and soul, their innate wisdom and purpose, beyond all their conditioning; the disconnection between nature and its sacred place in our lives, restoring our reverence for the earth as the foundation of our being; and the disconnection between technology and its true purpose, realigning what we build so that it serves life and fosters harmony, and never domination. And we do this through education, research, life design, and community action, guiding people and communities toward deep self-reliance, an expanded awareness, and a shared regeneration, beyond the limits imposed by profit, religion, race, gender, nation, fear, or any form of division.

Core Goals

To carry out this mission, these are the goals we hold. To find the truth in our past, our history, and our myths, uncovering the untold and the erased and the buried, especially the knowledge of space and the earth and the human body and the evol-

ution of nature and the old civilizations and the natural technologies and the sustainable ways to live. To reawaken humanity, sharing what we find so that people may become aware and confident and multi-skilled and self-reliant, living ethically and with purpose and a deep connection to the earth. To restore nature, regenerating ecosystems and redesigning how we touch land and food and water and air, on principles of balance and respect and regeneration. To redesign life and society and technology, building tools and systems that heal and connect and teach and produce, rooted always in ethics and ecological wisdom. To redefine success itself, remaking the failing systems of education and religion and health and law and economy into life-affirming alternatives that serve communities and the future rather than corporate profit. To share knowledge freely, creating open-source handbooks and tools and courses and media, so that every human has what they need to transform their life. And to unify across cultures and across time, merging the wisdom of our ancestors, the challenges of our present, and the visions of our future into one living model of planetary citizenship, one global family, one shared evolution.

THE HUNATE BOOK

Start, and Where We Are Going

I do not know exactly when it started, how many years it took, how many forms and paths it took, how many books and people and projects shaped it. But looking back, this is how it feels, and how it looks: a movement in phases, each one growing out of the last.

Phase One: The Personal Journey of Self-Discovery

The first phase was my own life, my journey of self-discovery, told in full in the first book of this series. It was full of curiosity and silence, of pain and healing, of self-learning through self-questioning, of anger and wildness and complaint, the long effort to break through. My own life was the thing that first drove me to look hard at the problems of the world, and to search this world for a way out.

Phase Two: The Joon Project

The second phase was The Joon Project. Joon means moon in Nepali, and it was a symbolic thing, an attempt to build, on real ground, an example of a better community out of everything I had learned. It was an international hub, open to anyone who wished to join and share and brainstorm and build, where we experimented with alternative systems drawn from nature and ancient knowledge and modern tools, a fresh community begun as if from scratch, like a new civilization on the clean face of the moon, where the broken laws of the earth did not apply.

Phase Three: Planning and Documentation

The third phase is the one we are in now: a time of reflection, of documentation, of planning for what comes next. It is where this book, and the others in the series, are being written.

Phase Four: The Hunate Movement

The fourth phase is the Hunate Movement itself, the coming back to the community with everything we have understood from the phases before. It is where we create our digital presence, introduce the project to the world, share our philosophy and our worldview and our blueprints, spread awareness to the many, and reach out to the engineers and mentors and district representatives and donors and supporters who will form the working team.

Phase Five: The Seven Provinces

In the fifth phase, once the team and the groundwork are ready, we put the work onto real land. We invite hub partners and open the way for them, we gather volunteers and supporters and all that is needed, and we begin to build: seven family hubs and seven orphanage hubs, one of each in every one of Nepal's seven provinces.

Phase Six: The Hunate Base

In the sixth phase we build the Hunate base, the headquarters, somewhere in Nepal: a living, practical, purposeful, regenerative community that applies everything we have learned, following nature's law and modern innovation. For this is what Hunate is, in the end, to find the failing system in every field, and to redesign it into a better, more natural alternative.

Phase Seven: The Seventy-Seven Districts

In the seventh phase we expand from fourteen hubs across seven provinces to seventy-seven hubs across all of Nepal's districts, weaving a stronger, interconnected, supportive community, and beginning to redesign whole settlements, ten houses and more at a time, reshaping how communities and even cities are formed. We envision the whole of Nepal becoming a Hunate hub for the world to come and learn from, a place travellers arrive at to learn a way of life: good food, homes and communities and cities built on natural law, technology in the service of humanity and nature, and grown-ups living for the next generation, for evolution, for health and love and creativity.

Phase Eight: The Seven Continents

And in the eighth phase we go beyond Nepal, to design and build across the whole earth, on all seven continents, until Hunateculture is simply a way to live.

THE HUNATE BOOK

How Exactly to Change

Change must begin with the self. The first step is to understand who you are: what you are made of, how you were made, what shaped you, which elements and people and environments played their part. To understand how you function, your mind and body and soul, your emotions and intellect; how you were educated, and how you were shaped by your parents and your community and your school, by social media and politics and films and songs. To know how your senses work, how strong your body and mind and spirit are, how well you understand nature and connect with it, how far you can think into the future, how much of the true past you actually know.

All of this matters, because it decides how clearly you can see the bigger picture, how independent and creative and intellectual you can be, how sound and moral your choices are, how flexible you can be in change, and how completely you can break free of the mental cage you were raised inside. And so the first journey is to become Hunatian, walking through the challenges and tasks we have designed to rewrite your patterns of thought and to change your habits. From there, the way opens outward, to the family, to the community, and at last to the world.

The Way for the Individual: Becoming Hunatian

This is the path of personal transformation, a self-designed journey for cultivating self-awareness, mastering your own inner landscape, and aligning your life with the principles of Hunate. Through a structured set of practices and exercises, you learn to question your conditioning, to rediscover your true purpose, and to become a self-reliant, conscious being ready to contribute to a regenerative future. It is the foundational step, for global change begins with individual awakening, and it has a whole book of its own.

The Way for the Family and Community: Hunateculture

Once you have walked the first path, you begin, almost on your own, to see a clearer future, for yourself and your family and nature and the generations to come, and to understand Hunateculture. This is the life-design system for rethinking and redesigning and rebuilding our family structures, our homes, our farms, and our businesses. It blends the ancient wisdom, of Vedic astrology and Vastu and Ayurveda and yoga, with the modern approaches, of eco-architecture and permaculture and ethical technology, so that a family can craft a personal way of living that holds the balance among humans, nature, and technology. It is about creating living examples of regenerative life at the level of the household, and it, too, has its own book.

The Way for the Community: The Hunate Movement

Join the movement, and support and spread its message to those you believe will benefit. This is the wider social effort to awaken communities to the failings of the current systems, and to share practical solutions through the Hunate Project and Hunateculture. It is a citizen-led initiative, built on trust and mutual understanding and common goals, working with as little reliance as possible on money or politics. It is the phase of active outreach, inviting individuals and families and organizations into the shared work of redesigning society from the ground up, and it, too, has its own book.

The Way for the World: The Hunate Center

And this is the future global anchor of it all: the Hunate Center, the base. More than a place, it will be a living, breathing model of a regenerative village, a hub for living and learning and growing, where families and orphans and mentors and engineers converge. The Center will be a blueprint for how any community might redesign its life, train the Hunatians to come, test new ideas, and share those ideas openly with the world, proving that this transformation is real, and practical, and able to grow across the whole earth.

A Final Word

Let me end honestly, about how I have written all of this. Hunate is about researching and finding and sharing, about trying and inspiring, about sparking curiosity and chal-

lenging our thoughts and feelings and the old dogmas and traditional ways, and so I have written it accordingly. I have had to kick a few egos, and to ask the questions no one asks, because that is the only way to trigger real thought and real analysis. A little hurt is sometimes what brings change; a little push is necessary; a little anger is needed for growth. I cannot always be soft and humble and polite; that is simply not who I am, and I want you to remember it.

And understand this too. I am not trying to change the world. I do not care to. I am speaking my heart. Those who find something true in these pages, I welcome with all of mine. And those who are offended, I will not soften myself for them. This is the way of Hunate. And this, for better or worse, is the way of Khem.
